

Homework 1: Simple WebScraping

PACKT editor releases each day a different free book on its webpage, we want to know, each morning, the title of the book, so we can decide if we want to download it or not.

The webpage is:

<https://www.packtpub.com/packt/offers/free-learning/>

Your goal is to build a simple python application, using the following libraries:

- urllib2
- BeautifulSoup4

To scrape some text, namely the book title, from the webpage, and print it (with the ultimate goal of using any notification method to send the user the information).

Requirements

- Code must be developed **entirely** on github.com.
- Code must follow good practice and good python conventions: variable naming, indentation, documentation, etc.
- Code must work.

Scoring: If all requirements are met students get **0.5 extra points** for Practice 1.
